HerZim Metal Mouldings

The trade name "HerZim" is used to describe the elastic filler type of moulding. It was originally designed to replace the solid aluminum sections, where nail heads were concealed by drilling holes and burring the aluminum over the nail heads, and filing off to make a smooth, neat job.

HerZim Mouldings are furnished ready to apply and may be nailed on the body either in the natural finish and painted afterwards, or may be painted or enameled first and then nailed on the body. After nailing, the filler or insert strip is inserted with a simple wood stick and will retain its position in the groove indefinitely, in all weather conditions.

HerZim Mouldings are adaptable to any body curve or contour either in deck, drip or body construction. Many manufacturers form and enamel them before putting them on the bodies. This procedure has made it possible for the body to be entirely finished, painted and trimmed before moulding is applied. The deck material and trimming is then applied and the last operation is applying the drip moulding or roof moulding, without marring the body, paint or deck in any way. There is no finishing necessary on HerZim Mouldings after they have been applied.

HerZim Aluminum Drip Moulding

(Fully Covered by U. S. Patent No. 1,448,986)

Packed in Tubes; 7 ft. and 8½ ft. Lengths; 6 Pieces to a Tube; 10 Tubes to a Case;

Close-Down **Aluminum Mouldings**

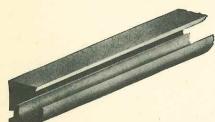

Aluminum "Close-Down" Mouldings have been developed and patented by Moulding Engineers, and have achieved the result of cutting the excessive production costs entailed in the application of solid aluminum mouldings. They are furnished punched with nail holes ready to apply to the Top or Body and are nailed on with ordinary moulding nails and a regular nail set.

Belt and Roof mouldings have two wings or sides, which, after moulding is nailed in position, are closed down with a metal-worker's spoon (see illustrations of Special Tools) and hammer—until piers on wings rest against the base. Care should be taken to bend wings in evenly (not one before the other), and when properly closed the only finishing necessary on this type moulding is to remove center seam with emery cloth.

With the aid of forming fixtures, lateral curves as small as two-inch radius are possible. Horizontal curves are made without the aid of any fixture except a small strip of leather to keep the two wings apart.

Drip Mouldings are made with single wing, which is also closed down with metal-worker's spoon and hammer, and, as with belt and roof mouldings, it is only necessary to rub off seam with emery cloth.

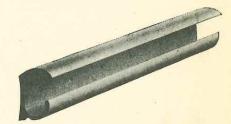

Close-Down Aluminum Drip Moulding

(Fully Covered by U. S. Patents Nos. 1,714,478, 1,714,479 and 1,771,386)

In Tubes-7 ft. and 81/2 ft. Lengths-6 Pieces to a Tube-10 Tubes to a Case. All Styles are also Furnished in Bulk 15 ft. Lengths Only.

The sections illustrated are but a few of the many available.

Method of Applying Close-Down Aluminum Mouldings

The moulding is first nailed in position with ordinary moulding nails. The nails are driven, through holes punched in the moulding, with a special nail set which prevents any possible damage to the moulding or body. The wings of the mouldings are then closed down with one of the special closing-down tools, the flat-faced tools for all mouldings or the concave tools for all mouldings, except lateral curves. There is a special tool (No. 3) for closing down the single wing on drip mouldings. After this operation the finishing is completed by removing the center seam with emery cloth.

1—Nailing to Body with No. 212 Nail Set

2—Closing Down with No. 1 Spoon

3—Finishing with Emery Cloth

4—Wing of Drip Moulding Being Closed Down with No. 3 Tool

Spoons are all drop-

No. 212

Special Tools

Roof Moulding Sets

"Bent to Shape" roof moulding sets have been discontinued. A substitute for any complete set can be made with corners (M1-431) and straight lengths (Style 1794).

Bolt-On Mouldings

Installing Bolt-On Mouldings

The original method of installation was the use of standard carriage bolt or special head screws. This method is quite positive but the operation is slow and somewhat expensive. It is adaptable to steel or wood.

For attaching mouldings to metal we now recommend the clip method, which, when properly engineered is very satisfactory and more economical than bolts. Various types of clips are available.

For attaching mouldings to wood or other porous backing it is advisable to spotweld a special head nail to the moulding and insert in hole and clinch on reverse side if necessary.

Sample installations can be accomplished by filling a portion of the moulding with plastic wood and then cementing in place.

Whatever your problem, our engineers are at your service and upon receipt of your inquiry we will be pleased to recommend the proper method of application.

Material and Finish of Rolled Sections

BRASS CHROME PLATE is the most satisfactory finish for lustre and durability. However the cost is maximum. STEEL CHROME PLATE is very satisfactory for interior trim and especially recommended when moulding is applied on heating units over 350 degrees fahrenheit.

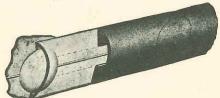

STAINLESS STEEL—16% straight chrome—is used for the ordinary run of automotive production trim and for interior or exterior finish. However, on store front trim we recommend 18—8 analysis. Stainless Steel is not recommended on heating units when moulding is subject to heat over 350 degrees fahrenheit.

CHROME PLATED STEEL, plated before fabricating, is less expensive than steel chrome plated after fabricating. However, the lustre is not so satisfactory and some light scratches on the surface can be expected. It is used for an economical trim on cheaper quality merchandise and will stand heat, 450 degrees fahrenheit, before discoloring.

CHROME PLATED ZINC, is the least expensive of chrome plated mouldings. However, the zinc is plated before fabricating and the lustre is not so satisfactory. Also, light surface scratches are noticeable. Chrome zinc also has advantages and can be easily bent around corners without the use of special bending fixtures. It is an inexpensive trim for all-around purposes and will stand heat, 350 degrees fahrenheit, before discoloring.

Bolt Moulding

Specify thickness of metal and correct clips can be furnished.

The stock length of all Bolt-On Mouldings is 12 feet. Available in Bulk Only.

End Forms

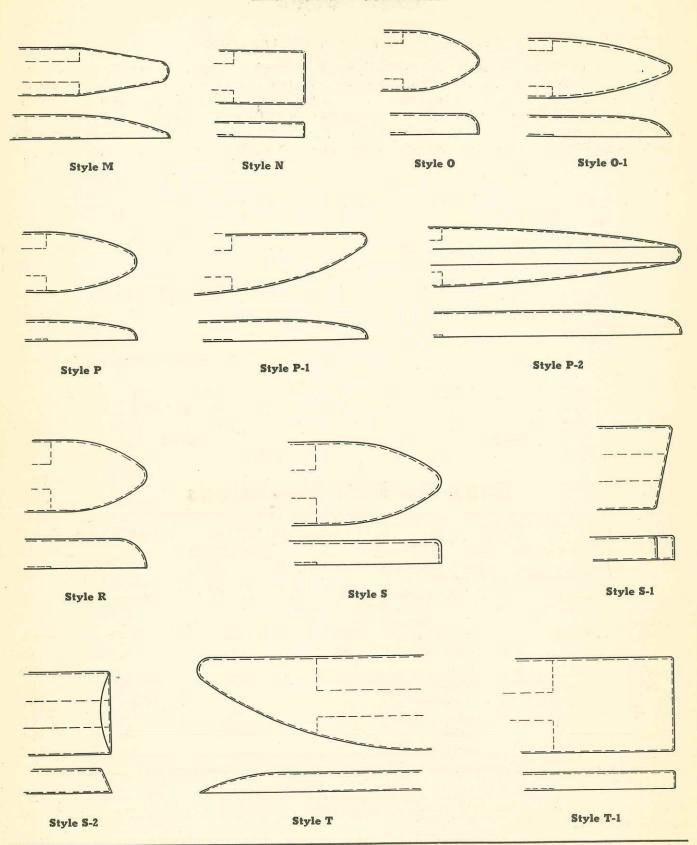

Special End Forms for Bolt-On Mouldings

By the use of end form dies we can furnish any length mouldings from four inches to twelve feet. It is sometimes advisable to use a square style on one end and a pointed or round style on the other. When moulding is formed on both ends the bottom legs are notched for insertion of bolt or attaching clip. Various decorative schemes can be accomplished by forming the ends of mouldings and then attaching in groups. The following listed styles are stock dies. Should your application require a special end treatment such as an angle trim, mitre trim, or cope joint, our tool engineer can design dies to meet your requirements.

Retainers come with nail holes punched. Covers (except style 3512) can also be furnished in Stainless Steel.

Special Tool

A special tool for applying ''Snap-On Cover'' mouldings has been developed by us. Its proper weight distribution eliminates denting covers.

Wing-Lock Mouldings

Wing-Lock Aluminum Mouldings have the advantages of a filler-moulding combined with solid metal finish and construction. The base section of any Wing-Lock Moulding can be formed to any shape or contour, the same as Solid Moulding, and after nailing to body, the filler is easily led into the groove and clinched in place by a slight blow on top. The filler, once locked in position, cannot come out, and the finished job is as solid as though it had never been two pieces.

Both base and filler section may be sprayed or enameled before applying, and if a soft or leather faced block is used in locking Filler in position, paint will not be damaged or marred.

Inner-Lock Mouldings

Inner-Lock Aluminum Mouldings are proving popular with Body Manufacturers, where a concealed Nail Moulding is required. Inner-Lock, after applying, needs no metal finishing whatever, and cannot be told from Solid Aluminum Moulding. Inner-Lock Roof and Belt Moulding can be used wherever a similar solid moulding would be applied.

Inner-Lock Mouldings are easy and simple to apply. On lateral curves, both sections should be formed before applying. On horizontal curves it is not necessary to form either Nailing Strip or Cover. Nail the Nailing Strip to the body or roof, hold the Cover Strip in place, and pound down, using a leather or soft-faced block against the moulding.

HerZim Sealer and Sealer Gun

Waterproof, oil proof and heat proof. Has instant adhesion and permanent gloss. May be applied to any surface. Ideal for waterproofing edges of tops and roofs; filling cracks in moulding joints; sealing roof mouldings; repairing and patching torn tops. Easily applied with gun. Available in quarts and gallons.

Window Frame And Screen Assemblies

For Trailer Coaches, Cottages, Cabins and Camps

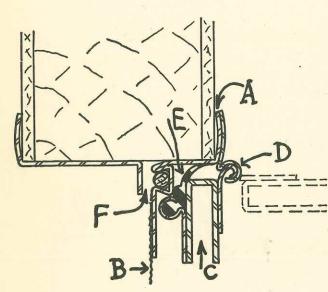

These assemblies have been created to furnish practical, handsome window frames and screens for builders who realize the need for a waterproof and insect-proof window frame, that will withstand the stresses and give real service over a long period of years.

Both HerZim Assemblies are so made that the installation is very simple. The opening is cut to size, and the frame inserted in two parts—one from the front, one from the back.

These windows add much to the appearance of any job and do away with leaky windows.

They are handsome, well made of the best materials and practical in design. Operation is easy, with three different open positions.

Fit snug and flush with body or side wall.

Specifications

Over all thickness of partition $1\frac{7}{8}$ " and over. For over all thickness of less than $1\frac{7}{8}$ "—down to $1\frac{1}{8}$ "—we furnish a smaller inside garnish moulding, our Style 3172.

Inside Garnish Frame—buttwelded corners.

Complete outside Frame assembly includes

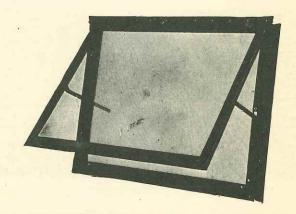

- A-Outside Garnish Frame.
- B-Copper Window Screen.
- C—Glass Frame, with removable bottom cross section.
- D-Streamline Glass Frame Hinge.
- E—Rubber seal.
- F—Open space between frames may be left open or filled with small piece of wood.

Compact Sectors, to open and close window and hold it open at the desired angle.

HerZim Standard Window Frame

Her-Zimite Fibre Board

In Three Different Grains

Her-Zimite is a new product, that is needed in every body and repair shop. It is made from .070 fibre board stock, and is Pyroxylin coated. It is easy to apply, retains its finish indefinitely and is strictly a quality product. Unless otherwise specified, black will be furnished. Colors are available on special orders. Her-Zimite is ideal for inside trim on doors, cowls, etc., and is available in two sizes, 30" x 52" and 34" x 52", with 25 sheets to the shipping case.
